## Presentation By

Dr Chitra Pandya
Under Guidance of
Dr Utkarsh Shah

- https://www.youtube.com/watch?v=4HpvBZnHOVI
- What was that???
- Would this shape be formed if I changed the pattern of the pegs?

## Lecture Format

- Brief over view of Mean, Standard Deviation
- Distribution of Data
- Normal Distribution: Characteristics
- Normal Probabilities
- Standard Normal Distribution
- Central Limit Theorem
- Weight (in kg ) of 9 children
3
5
5

## Mean Deviation and Standard Deviation

- Mean Deviation $=$ Average of deviations form arithmetic mean $=16 / 9=1.7$
- Standard Deviation = 2.5

| Root |  | Weight(x) | ean(u) | $\begin{gathered} \text { Deviation }=x- \\ u \end{gathered}$ | Deviation Square |

## Data Distribution

- Data can be "distributed" (spread out) in different ways.

(

## Normal Distribution/ Gaussian Distribution

- Nothing "Normal" about it!!
- One of the most important distributions is the Normal Distribution
- When a set of continuous data forms a bell shaped curve when plotted in a histogram

- Many Biometric measures follow ND for large sample sizes

Eg. Adult Height, Hemoglobin, Weight, Systolic Blood

- But why?????

- Reason for Normal Distribution in Nature $\rightarrow$ Biological parameters regress towards the mean
- The Sports Illustrated curse and regression to the mean : Showing of an athlete on the front cover of that magazine applies a sort of black magic to that athlete's capabilities, and that he will soon perform badly, or not up to expectations.

## Just for Fun! You can check for yourself if its true!!!!!!!

Height of Child $=$ More than average height of population by 0.6 times the difference between the average height of parents and the average height of the population!!!!

## Characteristics of a Normal Curve

- Bell Shaped Symmetric Curve
- Mean=Median=Mode

Histogram for Normal Distribution (mean $=3.8$, $\mathrm{sd}=4.3$ )

- Unimodal (One mode, One peak)
- Completely defined by 2 statistics: Mean and Standard Distribution
- Curve on one side is mirror image of the other side
- Highest frequency is in middle around the mean; Smoothly decreases on either sides; Lowest frequency at the extremes
- Total area under ND curve = 1 or $100 \%$

The symmetric, unimodal form of a normal distribution makes both the mode and median equal to the mean. As you see in the diagram, the smaller the value of $\sigma$, the more the data cluster about the mean, so the narrower the bell shape. Larger values of $\sigma$ correspond to more dispersion and a wider bell shape.

\section*{Normal Probabilities

nttos：／／www．youtube．com／watch？ $\mathrm{V}=6 \mathrm{YDHBF} \mathrm{VIVIS}$
－So how can we know the probabilities？

## Confidence Limits

- Mean $\pm 1 S D \rightarrow 68 \%$ of the values in the distribution ( $34 \%$ on one side)
- Mean +2 SD $\rightarrow 95 \%$ of the values in the distribution ( $47.5 \%$ on one side)
- Mean +3 SD $\rightarrow 99.7 \%$ of the values in the distribution ( $49.85 \%$ on one side)
Q. Given Mean weight $=20 \mathrm{~kg}, \mathrm{SD}=5 \mathrm{~kg}$

What are the chances that the weight of 1 child will be:
-more than 30 kg ?
-more than 27.5 kg ?

- Normal Curve with Mean=0, SD=1

## Standard Normal Distribution

- There is only one standardized normal curve
- Based on infinitely large number of observations
- Standard normal variate/Normalized variable $(Z)=(x-u) /$ S.D.
- $Z$ values also follow ND with mean=0, $S D=1$

| Areas of the standard normal curve with <br> mean 0 and standard deviation 1 |  |
| :---: | :---: |
| Relative deviate $(z)$ <br> $\frac{(x-\bar{x})}{\sigma}$ | Proportion of area <br> from middle of the curve of <br> designated deviation |
| 0.00 | .0000 |
| 0.50 | .1915 |
| 1.00 | .3413 |
| 1.50 | .4332 |
| 2.00 | .4772 |
| 3.00 | .4987 |
| 4.00 | .49997 |
| 5.00 | .4999998 |

## All of the Infinite Normal Curves can be converted to a Standard

## Central Limit Theorem

- https://www.youtube.com/watch?v=jvoxEYmQHNM
- The distribution of averages approaches Normal distribution
- Even when distribution from which the average was computed is not normal
- Its mean will approach the mean of the parent distribution
- As the sample size increases

Keep Calm and be
Normally Distributed!
